Decommissioning activities at the North West Hutton field have been completed. The North West Hutton installation was located in Block 211/27a, 130km north east of the Shetland Islands.

The jacket has been removed down to the top of the footings -96m LAT (Lowest Astronomical Tide), which is approximately 47 metres above seabed. The adjacent sonar image shows the vertical extent of the footings above seabed. Depths are in fathoms.

Seabed debris clearance and trawl sweeps of the area have been completed.

The 10" gas import pipeline PL147 has been left in place as it was already trenched and buried. Trawl sweeps have been successfully undertaken over the pipeline length.

The 20" oil export pipeline PL148 has been trenched but it has not been buried. Pipe sections at the crossing locations have been removed. Trawl sweeps have been successfully undertaken over the pipeline length.

Fishermen are advised to avoid fishing:

- Within 500 metres of the remaining platform jacket footings at Latitude: 061*06.367' N Longitude: 01*18.441' E (WGS84, degrees & decimal minutes)
- Within 100 m of the PL147 pipeline end at Latitude: 061° 00.064' N Longitude: 01° 23.729' E (WGS84, degrees & decimal minutes)

The North West Hutton jacket footings will remain on the seabed and will be marked on the relevant charts, FISHSAFE and in the Kingfisher Information Service UKCS database as an obstruction to be avoided.

Environmental and pipeline surveys are to be conducted on site in 2013 and at suitable intervals beyond 2013. Such operations and any others in the area will be subject to the normal notification processes.
